

New user-friendly interface for the management of the Smart Home

**With a unified design for touch screen and monitoring application,
extremely easy to use and customizable.**

A new era of AVE home automation is ushered in with the introduction of a completely redesigned Graphical User Interface (GUI), that is more user-friendly and better able to manage all the functionalities of AVE's smart building systems.

The new GUI has been developed after careful analysis of end-user needs to facilitate interaction with AVE home automation systems and to create a more intelligent and intuitive management interface. The result is a **unified interface for both touch screens and applications** (available on the main platforms), able to respond to usability and customization needs.

About the **Ave Cloud application**: the environment has been redesigned to integrate seamlessly with the graphics of the intelligent systems that manage the building, using the same background and language for icons, text and graphic elements, ensuring a smooth and seamless transition when accessing your system.

The new GUI is based on different levels of interaction and the frequency of recurring actions. The first level is the home page, where the user can find a general overview of the system and the most common actions. From here it's possible to access the second level to control devices in a room or category (e.g. all lights). The third level contains specific settings and adjustments. In addition, **interactive pop-ups** further facilitate the management of the home, significantly reducing the possibility of errors and improving the understanding of commands.

The new AVE Home Automation GUI has been designed for maximum user-friendliness and has **three main themes**: LIGHT, TEAL and DARK. Each theme also includes a 'minimal' version, without the representative images of the rooms, for those who prefer a more essential visualization. From the home page, it's possible to change the type of display and to switch from 'Rooms' to 'Devices'; in this way, the list of categories is displayed, and devices can be filtered by room.

With its new graphical user interface, AVE offers end-users an unprecedented home automation management experience with an intuitive, customizable and highly functional design. **A new smart dimension for the home.**
